I used a lot of the typical tags on my webpage (title, style, meta, head, body, table, etc.) to create a basic site that is easily readable. I also used img, div, caption, bold, a, and h1. I changed the background colors of my table and my actual page to make my pictures stand out. My favorite tag I used is the dropdown button! I added other resources from the hospital as more info for whoever is looking at my site. There are a lot of specific tags in my <style> section due to the dropdown button. Figuring out the CSS codes for centering my pictures was pretty difficult. I also added different fonts for the body and titles on my page. I've never coded anything before and this was actually a really fun project. I want to start doing more of this! I also got my entire site to validate (after many hours) and that was a really great feeling. I'm really proud of how this turned out!
